Reliability and safety of load-lifting cranes of the bridge type which has especially fulfilled normative service life are substantially defined by a level of their equipment devices and devices of safety, major of which are carrying capacity limiters and parameters registrars of work of the crane.

Now for used in the industry noncontrollable crane asynchronous electric drives development of the carrying capacity limiters with use of modern programmed microcontrollers and indirect methods of measurement of weight of a lifted cargo is perspective on the basis of informative parameters of the asynchronous motor.

The mathematical model of the electric drive of the mechanism of rise has been developed. The opportunity of realization of the carrying capacity limiter for cranes of bridge type with use of an indirect method of measurement of cargo weight is proved on mathematical model and by experimental researches. The informative parameter is revealed and experimentally confirmed (rotation frequency n) with which help it is possible with sufficient accuracy to determine weight m of lifted cargo on linear function or consisting of linear pieces to the characteristic $n=f(m)$ which enter in memory of the microcontroller directly on the crane, allows to take into account its specific features, such as transfer number of the mechanism, frequency rate of tackle, efficiency of the mechanism, etc. The mathematical model of the mechanism of rise of the electric crane and the carrying capacity limiter is developed and researches of their teamwork are carried out. The way of definition of rotation speed of the motor on vibration diagrams of the stator frame of motor without the speed sensor is offered and checked experimentally up, allowing to determine with sufficient accuracy rotation frequency of the motor and to calculate weight of a lifted cargo.

The article is admitted to the International Scientific Conference «Innovation Technologies», Thailand (Pattaya), 20-28 February 2008, came to the editorial office on 12.12.07

PRINCIPAL AND SPECIFIC FEATURES OF DEVELOPMENT OF INTELLECTUAL AND INFORMATION SYSTEMS FOR SELECTION AND INTRODUCTION OF RENEWED ENERGY SOURCES

The constant reduction of mineral and raw materials resources, as well as growing negative effects such as heat, chemical and radioactive contamination of environment in combination with quick reduction of easy accessible fuel deposits, put the question of great increase the usage of the renewed energy sources (RES). RES are sources of types of energy, which are getting continuously renewed in earth biosphere such as solar, ocean, wind, river hydro power and geothermal energy. RES are clean from ecological point of view and do not create additional heating of the planet (so they are often called non-supplementary). The Studies in the field of RES have intensive development. Are they Currently Significant knowledge and experience are accumulated by now in connection with introduction of these energy technologies. At the same time, there is no practically information and economic foundation in view of modern information systems, which are based on knowledge that allows to choose efficiently, design and introduce RES. The Systems, which essential principal is base of knowledge or a model of the application domain and described by super high level language that is approximated to natural, are named intellectual systems (IS). The most typical representative IS are an expert systems (ES) and ontologies. ES is IS, which is oriented at spreading out the experience of highly trained specialists in areas, where quality of decision making traditionally depends on level of the expertise. The Ontologies are knowledge bases, which can "be read" and be understood, estranged from developer and / or physically divided by their users. The Principle difference of ES kernel and knowledge base (KB) from ontology is: in that that in ontologies contents and structure of KB are specified explicitly in ontologies, but in KB of ES - no. The Development of knowledge base both in ES, and in ontology includes conceptualization, formalization and realization. Conceptualization provides the structuring of the subject knowledge in the manner of field of the knowledge in ES and meaningful explicit model in ontology. Formalization transforms the conceptual model in formal or "computing". Finally, in process of the realization
